

Task 1: The Home Base – Lab Setup & Networking Fundamentals

Name: Mark Britto Roshan.G

Domain: cyber security

Internship: softnexus internship

Objective:

The objective of this task is to set up a cybersecurity lab environment using virtualization software and understand the basics of networking by connecting two virtual machines.

Software Used:

- * VirtualBox (or VMware)*
- * Kali Linux*
- * Metasploitable 2*

Procedure:

- 1. Installed VirtualBox.*
- 2. Downloaded the Kali Linux and Metasploitable 2 virtual machine images.*
- 3. Imported both virtual machines into VirtualBox.*
- 4. Configured both virtual machines to use the same virtual network.*
- 5. Started both virtual machines.*
- 6. Identified the IP address of the Metasploitable machine.*
- 7. Used the ping command from Kali Linux to verify network connectivity.*

Command Used:

ping <Metasploitable_IP_Address>

Example:

ping 192.168.56.102

Expected Result:

The ping command should receive replies from the Metasploitable machine, confirming successful communication between the two virtual machines.

Conclusion:

The virtual lab environment was successfully configured, and network communication between Kali Linux and Metasploitable was verified using the ping command.
